ideas were that the universe is made of one substance whose form is perpetually changing, and further that the sum-total of energies remains always the same. Also that 'the explanations of things are to be found within their own nature, and that no external beings or existences are required to explain what is going on in the universe,' with its corollary of a self-evolving universe.

It does not very much matter to science what these vague speculations lead to, for meanwhile it forges ahead in a hundred directions, in its own precise experimental way of observation, widening the bounds of the charted region of knowledge, and changing h u m a n life in the process. Science may be on the verge of discovering vital mysteries, which yet may elude it. Still it will go on along its appointed path, for there is no end to its journeying. Ignoring for the moment the 'why?' of philosophy, science will go on asking 'how?', and as it finds this oul it gives greater content and meaning to life, and perhaps takes us some way to answering the 'why?'.
