tion, and the other mainly on cottage industries? This is hardly conceivable, for one must overcome the other, and there can be little doubt that the big machine will triumph unless it is forcibly prevented from doing so. Thus it is not a mere question of adjustment of the two forms of production and economy. One must be dominating and paramount, with the other as complementary to it, fitting in where it can. The economy based on the latest technical achievements of the day must necessarily be the dominating one. If technology demands the big machine, as it does to-day in a large measure, then the big machine with all its implications and consequences must be accepted. Where it is possible, in terms of that technology, to decentralize production, this would be desirable. But, in any event, the latest technique has to be followed, and to adhere to out-worn and out-of-date methods of production, except as a temporary and stop gap measure, is to arrest growth and development.

Any argument as to the relative merits of small-scale and large-scale industry seems strangely irrelevant to-day when the world, and the dominating facts of the situation that confront it, have decided in favour of the latter. Even in India the decision
