lization is a marked change, a jump almost from the older type, and is intimately connected with modern industrialization. Inevitably it gives rise to new problems and difficulties, but it also shows the way to overcome them.

I have a partiality for the literary aspects of education and I admire the classics, but I am quite sure that some elementary-scientific training in physics and chemistry, and especially biology, as also in the application of science, is essential for all boys and girls. Only thus can they understand and fit into the modern world and develop, to some extent at least, the scientific temper. There is something very wonderful about the high achievements of science and modern technology (which no doubt will be bettered in the near future), in the superb ingenuity of scientific instruments, in the amazingly delicate and yet powerful machines, in all that has flowed from the adventurous inquiries of science and its applications, in the glimpses into the fascinating workshop and processes of nature, in the fine sweep of science, through its my-, riad workers, in the realms of thought and practice, and, above all, in the fact that all this has come out of the mind of man.

Government Checks Industrial Growth
