A built plan that encourages residents or office goers to move around on foot, in cycles or e-carts could further help in controlling the carbon emission from the space. Building cycling, walking and e-cart tracks is a great idea in this direction.
Nucleus Office Parks built 3 kms of walking and cycling tracks at One Green Mile, making it an equal street for all. Idea was to create infrastructure that is pedestrian friendly.

Innovative building material

According to the '2020 Building The Future Report' by PwC Global, by 2025, there will be 37 'megacities', up from 23 today. . Given that concrete production alone makes up 8 percent of total global emissions, our buildings' design and construct must change radically to reduce carbon emission.
The use of digital twins, which is a digital representation of a physical environment that collects real time data has proven to be very beneficial in regulating and rectifying energy usage in buildings, which is estimated to exceed their designed energy usage by 3.8 times.
Nucleus Office Parks has achieved 87K tons carbon reduction across their properties. 60 percent of their portfolio is powered through renewable energy.
Green finance
Incentivising green structures and buildings on construction loans or mortgage finance, are great ways to incentivise developers to build environment-friendly structures. In a recent development, Climate Bonds Institute issued Green Loan certificates to the company. The Indian GSS debt market is gathering momentum, and issuances like this prove the country's commitment to a sustainable future.
